

REVOLUTIONIZING DIGITAL MONITORING, REPORTING AND VERIFICATION

Partner: Wildflower Labs

Sectors: Technology, Agriculture

Service: Carbon markets, DMRV, Environment Monitoring

Symmetry has formed a partnership with Wildflower Labs on technology solutions to delivering Nature based Solutions. Wildflower Labs is a pioneering Digital Monitoring, Reporting, and Verification (DMRV) company that harnesses the power of drone technology, artificial intelligence (AI), and blockchain to revolutionize data collection and verification processes. The unique approach involves the use of in-house built drones for data collection. These drones, equipped with advanced sensors and AI capabilities, can efficiently gather a wide range of data from various environments. This data is then securely stored on a blockchain, ensuring its transparency, security, and immutability. The use of blockchain technology not only guarantees the integrity of the data but also allows for easy access and verification. This makes the data collected highly reliable and valuable for a variety of applications.

Our services cater to a broad spectrum of industries and sectors, including carbon markets, agriculture, forestry, biodiversity monitoring, and both terrestrial and marine environment monitoring. The data collected provides invaluable insights that can help these sectors make informed decisions, optimize their operations, and achieve their sustainability goals.

All the data collected is made visible on our platform, providing clients with easy access to their data whenever they need it. The platform is designed to be user-friendly and intuitive, making it easy for our clients to navigate their data and gain the insights they need.

At Symmetry and Wildflower Labs, we are committed to delivering high-quality data that our clients can trust. We believe in the power of technology to transform the way we collect, verify, and use data, and we are excited to be at the forefront of this revolution.
